ARRIED TRACTOR SPRAYERS

AGS 200, AGS 200 EN, AGS 300 EN and AGS 400 EN/L

INSTRUCTIONS FOR USE

The company AGROMEHANIKA reserves the rights to change the design or change the product without any obligation on informing the client before or after the changes have been made.

SPRAYER AGS 200

SPRAYER AGS 200EN, 300 EN WITH A SPRAYING BOOM
EC DECLARATION OF CONFORMITY

MANUFACTURER:

AGROMEHANIKA, proizvodnja in trgovina Kranj d.d.
Hrastje 52 a, KRANJ, SLOVENIJA

declares that the product:

SPRAYER AGS 200
SPRAYER AGS 200 EN
SPRAYER AGS 300 EN
SPRAYER AGS 400 EN/L

is manufactured in accordance with:

1. Directive on Machinery 2006/42/EC;
3. Rules on the requirements for the correct operation of equipment for the application of plant protection products, and on the conditions and method for inspections of such equipment (Official Gazette of the Republic of Slovenia, No. 101/2013)

The following harmonized European standards on safety were applied:

SIST EN ISO 13857:2008 - Machine safety – Safe distances, preventing reach of dangerous areas with upper or lower limbs.

Kranj, 11.3.2018

Head of production: (resp. for. tech. documentation)  Manager:
Matjaž Kuhar, engineer  Jan Šinkovec
Dear customer,

We would like to thank you for your trust, which you have shown by buying the sprayer appliance for chemical plant protection of the company AGROMEHANIKA. The reliability and efficiency of the appliance depends on how you will take care of the appliance. We advise you to read and consider this instruction manual carefully before connecting the appliance to the tractor. This manual contains essential information for efficient use and a long durability of the appliance.

1 IN GENERAL

Your spraying appliance has been designed and constructed for distributing of chemical agents in a water solution that are commonly used for chemical protection of agricultural cultures on the annual agrarian crops. The constructional design of the sprayer allows easy accessibility to the vital parts of the sprayer and even an easier handling. The strong construction, high-quality component parts and loads and loads of additional equipment ensures the user an efficient operation and an optimal consumption of insecticide and energy.

Do not use your sprayer for pumping or spraying of:

- water solutions with a higher specific weight and viscosity than water;
- chemical solutions which should not come in contact with some of the parts of the sprayer;
- drinking water;
- sea water and other salty solutions;
- water which temperature is higher than 40 °C or lower than 5 °C;
- all kinds of lacquer or varnish;
- fast dissolving diluents;
- oil or grease;
- liquids that contain granulates or hard swimming parts.

2 INSTRUCTIONS FOR SAFE OPERATION AND SAFETY WARNINGS

2.1 SAFETY MEASURES

The sign on the left is a safety warning sign. Take special care when you see this sign on your machine or in this instruction manual, since it is a matter of your safety. Follow the rules and instructions for a safe use which are listed bellow.

2.2 CONSIDERING THE SAFETY RULES

Read the instructions considering the safety rules in the operation manual of your machine very carefully. Make sure that the labels on the machine are in good condition and can be well seen. After repairing the machine or replacement of any spare part make sure that all of the labels are fitted on the appliance. Spare labels are available at your authorized seller of the appliances. Learn how your machine is working and how to handle it and its control units.

DO NOT ALLOW UNAUTHORIZED PEOPLE TO USE THE MACHINE!

Make sure that your machine is always in good working condition. Each unauthorized change on the machine can weaken the functionality and/or the safe operation and/or shorten the durability period of the appliance.
2.3 BE PREPARED FOR DANGER

Be prepared for a sudden fire.
Make sure that there is always a first aid kit and a fire extinguisher available while you work.
Make sure that the telephone numbers of your personal physician, ambulance, hospital and fire brigade is always kept on a good seen place.

2.4 UNAUTHORIZED PEOPLE

Every unauthorized person who is seating, standing or in any other way driving on the tractor can get hurt (he or she can fall of the tractor or get hurt by the means of the tractor). The person driving on the tractor can have influence on the driver who is operating the tractor or change its centre of gravity. The unauthorized person on the tractor can have influence on driver’s sight and can be held responsible for unreliable working conditions on the tractor. Do not allow unauthorized people to be in the immediate vicinity of the machine.

IT IS FORBIDDEN FOR UNAUTHORIZED PERSONS TO RIDE ON THE MACHINE!

2.5 SAFETY WHEN HANDLING CHEMICAL AGENTS

Be very careful when handling chemical agents and in this way avoid possible injuries or damages done both to you as well as to the environment:
- Be very careful when handling chemical agents.
Make sure that you do not come in direct contact with the chemical agents. Chemical agents must be handled in the same way as poison.
- Choose such chemical agents that are the least harmful to your health, the most efficient and easy soluble.
- Always read the instructions for use which are printed on the packaging of the chemical agents. Consider all of the rules and safety instructions, and use the instructions.
- While working always use protection devices for the respiratory organs, such as a breathing mask or a helmet with fresh air.
- Wear appropriate clothes while preparing the chemical agents. Use protection goggles, gloves, boots and protection clothes. Pay attention to your protection equipment. Do not use “worn” protection.

- Make sure that your protection equipment and clothing are in good condition. Dirty gasmasks can cause allergic reactions to the skin. Change the filter regularly!
- Choose “safer” chemical agents. Pay special attention to chemical agents which are not that dusty or do not cause allergic reactions to the skin.
- When choosing chemical agents pay special attention to those which are packed in a “safer” way.
The preparing of chemical agents should never take place in closed rooms. When you are preparing chemical agents turn off the machine and in this way lower the risk of spilling the chemical agent.

- The chemical agents should be prepared only in still weather or in a calm place.
- Make sure that your machine is regularly cleaned, since you can in this way lower the chance of a direct contact with the chemicals.
- For preparing and mixing of the chemical agents only tools for this purpose should be used: measuring scale, measuring tools, funnel, bucket. Make sure that the tools are cleaned regularly.
- Do not prepare more of the chemical agents than needed.
- Make sure that your working day in which you are using chemical agents is not longer than 8 hours. Avoid stress and heavy manual work.
- Before spraying and 8 hours after spraying it is recommended not to consume alcohol.
- Do not eat, drink or smoke while working with chemical agents.
- Do not try to clean blocked nozzles with blowing (by means of your mouth).
- Consider the abstinence of the insecticide in the spraying period.
- Immediately wash out your eyes with water if the chemical comes in contact with them.
- After spraying, wash your face and hands thoroughly before eating or drinking.
- Make sure that children and animals cannot get to the machine until this one was thoroughly cleaned.
- Clean the machine after using it, put it in an appropriate place and make sure that unauthorized people do not have access to it.
- After using chemical agents wash yourself thoroughly.
- Clean and wash the machine after every single use and before any maintenance work.
- In case you have a certain medical problem in the time while using the chemical agents, consult your personal physician and try to contact the selling agent who is responsible for your chemical agents.
- If you have an accident which involves a chemical agent, we advise you to do the following:
  - eyes and skin: wash with plenty of fresh water;
  - throat and gullet: drink loads of water (no milk!);
  - lungs: fresh air.

### 2.6 EVALUATION OF DANGER SIGNS ACCORDING TO DANGER

Each chemical agent has a danger sign printed on the packaging which conveys the degree of danger. If possible, avoid chemical agents which have a skull printed on the packaging or include other signs which say that certain chemical agents have an etching effect. Even if a packaging does not include signs of danger that does not mean that the chemical agents is not harmful or dangerous. Although you are using insecticides that have none of the danger signs printed on the packaging we advise you to handle them with extreme care, since they can be harmful to your health in the long term.

**Danger signs which can be seen on packaging of chemical agents:**

1. Poisonous materials – in the case of poisons or very toxic chemical agents.
2. Harmful and irritable materials – in the case the chemical agents are harmful to your health and irritating to your skin.
3. Corrosive materials – for all chemical agents which have an etching effect.
4. Oxidising materials – for all chemical agents which have an oxidising effect.
5. Inflammable materials – for all chemical agents which are inflammable.
6. Explosive materials – for all chemical agents which can explode.
2.7 MECHANICAL SAFETY

- Do not touch the machine while working!
- Do not remove safety labels or any other safety equipment of the machine!
- Do not exceed the recommended air pressure in the tyres!
- Maintain the tyres regularly!
- If you want to use the machine in the public traffic you must fit it with lights and other illuminates in accordance with the traffic regulations.
- No not enter the reservoir in the time of preparing of the chemical agents or cleaning of the reservoir!
- Never exceed the working pressure of 15 BAR (that is the maximum allowed working pressure on sprayer appliances)!
- Do not start working until you are sure that there are no unauthorized people in the near of the machine!
- Pull out the key from the key-lock after you have finished working and in this way prevent a sudden start of the machine.

2.8 DANGER CAUSED BY LIQUIDS UNDER HIGH PRESSURE

- The liquid which leaks from the pipes can be under high pressure and can cause injuries to your skin, even more; it can cause dangerous injuries if the liquid spreads under your skin.
- Never try to dismount a hydraulic pipe or any other of the hydraulic installation as long as this one is under high pressure. Before you start up the hydraulic system make sure that the installation is safe.
- Help yourself with a piece of cardboard when trying to find the place of leakage. Protect your hands and body by means of gloves and protective clothing if you are handling a high pressure hydraulic system.
- In the case of injury immediately call your personal physician. Each penetration through the skin must be stopped; the liquid must be removed within a few hours.
2.9 WORKING PLACE OF THE MACHINE OPERATOR

- There is only one person needed for operation the machine. This person does not need an assistant. The operator of the sprayer is also the driver of the tractor.
- This machine can be operated by a person who is older than 18 years and has the needed know-how that is needed for a safe and accurate operation of spraying appliances.
- The person needs to be in good health – mentally and physically.
- Operational work and maintaining of the sprayer can be only carried out by authorized personal that has the needed know-how for this type of work.
- The operator of the sprayer must have a medical certificate (in accordance with local regulations).
- The working place of the operator: 1 meter around the machine and tractor.
- While spraying keep the windows and doors of the tractor closed. It is recommended that the operator has a hermetically closed cabin which allows the operator to create overpressure with aeration of fresh air that disables chemically polluted air to enter the cabin.
- While spraying, it is recommended that the operator stays in the cabin for about 90-95% of the time, so the chemical agents cannot have influence on his or hers health. Should the operator notice a change in the working of his or hers organs or feel dizzy, he or she should immediately put on the protection breathing mask. However, the best thing to do is to leave the field and look for shelter in a cleaner area.

2.10 PERSONAL PROTECTION

- The operator is advised to use well buttoned clothing and efficient protection equipment while working.
- The operator can come in contact with chemicals through his or her skin, mouth or nose. If you do not work safely even the best protection equipment cannot be any use to you.
- A safe working with sprayers requires full attention of the operator, so listening to music (per headphones) while working is not recommended.

WARNING: To prevent inhaling and/or entering the chemicals through the mouth it is recommended not to eat, drink or smoke while working!

2.11 BREATHING PROTECTION

There are many different types of filters available that can protect you against inhaling chemicals.
- It is recommended to use masks that protect the whole face and are fitted with combinations of different filters (filter for gas-smoke). An even more efficient protection can be achieved by means of a protection helmet in which overpressure can be created.
- Make sure that you are using an appropriate filter:
  - A (brown): can be used for most organic chemicals.
  - B (grey): can be used for most anorganic chemicals.
  - P (white): can be used only for liquid or powder
chemicals.
- Combination of a brown/white filter with the mark A2P2 in the European Union can be used for most organic chemicals. The mark A2P2 refers to a combination of filters which provide appropriate protection against most gases and vapours that are created by using liquid or powder chemicals. A2 refers to protection class II which means that you can use the filter until it reaches a concentration of 0.5 volume-percentages. P2 refers to gas protection class II.
- The combination B (grey/white) filter must be used in the case of handling inorganic chemicals.
- Before using the mask check the tightness and sealing of it. Check the mask for damages and make sure that the outer valve is clean and can be closed without any problems.
  - Write down the date of the last usage of the filter. The A2P2 filter must be replaced once a month nevertheless how many times it was used. Filter B must be replaced after every single use! The filter must be used within 6 months after the packaging of the filter was opened. Make sure that used filters are destroyed in accordance with local regulations.
  - Never check the efficiency of the filter by smelling:
    - certain poisonous elements are odourless,
    - the concentration of the poison cannot be always noticed by human nose,
    - smelling of certain elements can damage the nasal mucous membrane.
  - Always check the expiring date of the filter.
  - The filter must be hermetically sealed after usage.

2.12 SKIN PROTECTION
It is recommended to wear the following clothes in order to protect your skin:
- Rubber gloves in order to protect your hands which must be long enough. If the gloves are worn they need to be replaced. Change the gloves after every fifth use. Powder the inside of the gloves.
- Rubber or neoprene boots that are resistant to water and chemicals.
- Overalls that are resistant to water and chemicals and are fitted with a hood. The overall must cover the ends of gloves and boots.
- A waterproof apron for protection of your clothes; in a well protected tractor cabin the apron can be removed.
- A mask that protects the whole face.
Make sure that all of your clothes are well cleaned after every use. Never perform spraying when your clothes are wet, since it can cause a strong contact with your skin. Be very careful in the case your skin gets injured. After handling chemicals always wash your hands with soap and loads of water. After you have finished working also wash your face.

2.13 MAINTENANCE OF THE PROTECTION EQUIPMENT
After every single use thoroughly clean your protection equipment. Wash the mask, boots, gloves and working overall with mild soap water and let them dry.
Store your protection equipment in a dry, cold and clean room. Never store your protection equipment in the same room as the chemicals.
Store your protection clothes apart from other clothes.
Protection equipment that gets dirty between handling chemicals must be cleaned in accordance with regulations on cleaning of dangerous materials.
2.14 SAFE OPERATION

Before starting working the operator must check the correct and safe operation of the machine.

- It is not allowed to spray in foggy and/or rainy weather or when the wind speed exceeds 4 m/s. The direction of spraying must be adjusted to the wind direction.
- If there are two tractors with spraying appliances working simultaneously, they must not pollute each others working area atmosphere. In order to protect your health pay attention to the wind direction and speed.
- Never bring personal things in the area of spraying or when handling chemicals. Before every meal thoroughly clean your hands and face and wash out your mouth with fresh water.
- Before filling in the chemicals check the functioning of the machine by filling the reservoir with clean water.
- The sprayer pump receives the power from the connecting shaft of the tractor by means of the cardan shaft. All of the driving parts can cause bad injuries so in order to avoid that please follow the instructions below:
  - To drive the pump only such a cardan shaft must be used which characteristics are in accordance with the recommendations of the manufacturer and which is fitted with a protection cover.
  - Connect the machine to the tractor only if the drive shaft (P.T.O.) is turned off.
  - Connecting and disconnecting of the cardan shaft must be performed only when the engine is shut off.
  - Before you load the drive shaft (P.T.O.) check the rpm of the engine and make sure that there are no people or animals in the danger area of the machine.
  - The cardan shaft should be cleaned and greased only when the drive shaft (P.T.O.) is turned off, the engine shut down and the start key out of the key-lock.
  - Do not turn on the drive shaft of the tractor (P.T.O.) without a reason and check if the difference between the universal-joint angles is not too big.

**Warning! Do not turn on the driving shaft of the tractor (P.T.O.) while the tractor’s engine is not running!**

2.15 SAFE MAINTENANCE

- Before starting to operate the machine learn how to maintain it. Keep the working place clean and dry.
- Do not grease, maintain or adjust the machine while this is moving! Do not touch moving parts of the machine! Turn off the machine and make sure that there is no working pressure in the circulation of the chemicals!
  - Do not maintain or service the machine before this was thoroughly cleaned.
  - During maintenance and servicing of the machine turn off the electrical charging by turning the start key or disconnecting the connections.
  - Disconnect the drive shaft of the tractor (P.T.O.) in order to avoid a sudden start of the sprayer.
  - Do not perform inspections of the machine without turning on the machine’s “safety” devices.
  - Do not perform welding of the machine if you have used ammonium nitrate or any other liquid that contains ammonium nitrate for spraying without having thoroughly cleaned the machine before.
  - Do not enter the reservoir to repair or clean it.
  - Support and safely mount all parts that need to be lifted during maintenance.
  - Keep all of the sprayer’s parts in good condition. Repair eventual damages immediately. Replace worn and damaged parts. Remove excess oil, grease or any other debris.
  - Disconnect the battery before you start to adjust the electrical system or perform welding on the machine.
  - During maintenance of the machine or cleaning the nozzles use appropriate protection equipment in accordance with the regulations.
  - It is strictly forbidden to release chemicals into the environment.
2.16 DRIVING ALONG ROADS AND STREETS

Do not drive around with your sprayer attached to the tractor. If this can not be avoided please consider the following:

- Drive along roads and streets with your sprayer attached to the tractor only when there are no chemical agents in the reservoir. The maximum tractor speed with a full reservoir of water must not exceed 15 km/h.
- Connect the sprayer to the tractor only if the load on the wheels does not exceed the prescribed maximal load. After connecting the sprayer to the tractor at least 25% of weight must be on front wheels. You can achieve these values by adding weights at the front and removing weights at the back of the tractor. Find out how many weights need to be added or removed by means of weighing the tractor before the first use of the sprayer.
- In the case the sprayer completely or partially covers the lights and signs at the back of the tractor you will have to attach some additional lights and signs onto the sprayer.
- Follow the traffic regulations when driving along roads and streets with your sprayer attached to the tractor.
- Keep the boom on an appropriate height when driving along roads and streets. In the upper position secure the 3-point suspension of the tractor in order to avoid a sudden fall or slip of the sprayer as well as its lateral oscillation.

2.17 PROCEDURES IN THE CASE OF ACCIDENTS WITH CHEMICALS

In the case your skin or eyes come in contact with chemicals or their solution, wash them out with plenty of water and repeat the process several times.

In the case of suspecting poisoning (symptoms: sweating, dizziness, depression, headache, sickness):

- immediately stop working;
- take off wet clothes;
- remain calm;
- if you feel sick because of consumption of chemicals try to throw up;
- lay on your side;
- immediately call for medical help and let the physician see the label of the chemical agent, so he or she will easier be able to determine the kind of poisoning.

In the case of suspecting poisoning the patient must not eat or drink castor oil, milk, butter, eggs and alcohol, since these ingredients worsen the poisoning effect.

2.18 RULES REGARDING TO USE OF SPRAYING APPLIANCES

The operator and user of the SPRAYER must be familiar with rules regarding plant protection.
3 LABELS WITH SAFETY PRECAUTIONS AND INSTRUCTIONS FOR USE

You can find certain safety and warning signs in this instruction manual that are also attached to the machine. Take a closer look at them in order to work safely. Follow the instructions and advice concerning precautions listed in the previous chapter.
Make sure that the labels on the machine are in good condition and can be well seen. After repairing the machine or replacement of any spare part make sure that all of the labels are fitted on the appliance. Spare labels are available at your authorized seller of the appliances.

4 DESCRIPTION

Sprayers type AGS 200, AGS 200EN, AGS 300EN and AGS 400EN/L have a modern design with a thin polyethylene reservoir with rounded edges, smooth inner walls and a sloping bottom. The construction assures a short centre of gravity between the tractor and the sprayer, good insecticide mixing, easy cleaning and complete emptying of the reservoir.

The sprayer consists of:
- a carrying frame with a polyethylene reservoir and a pouring sieve which are resistant to chemicals;
- a pump;
- a flow and pressure regulator;
- a suction filter;
- a pressure filter and
- three-way valves.

The standard equipment of sprayers type AGS 200EN, AGS 300EN and AGS 400EN/L also includes an additional reservoir for cleaning of the sprayer after finished working and a reservoir for clean water which is meant for washing of hands.

Standard spraying booms of 6m, 8m, 10m and 12m can be connected to all types of sprayers (a spraying garniter of up to 8 m of working width is recommended for sprayer types AGS 200 and AGS 200EN).

The following instructions include detailed information on sprayer’s component parts and how to handle them; the second part of this manual includes a catalogue of spare parts.

Since this manual includes information on all sprayer models only pay attention to those parts that refer to your model.

4.1 LIFTING POINTS

When loading or unloading the sprayer onto or from the truck, use the standard lifting points of the three-point lifting system or, when this is not possible, the bottom of the sprayer (in case of using a fork lift).

4.2 COMPONENTS OF THE SPRAYER

1. frame
2. suction filter
3. three-way valve
4. pump
5. main reservoir
6. ablution reservoir
7. clean water reservoir
8. level indicator
9. pressure regulator
10. manometer
11. selection valve
12. three-way valve with a release
13. cover with a pouring sieve
14. identification plate
15. spraying boom
4.3 IDENTIFICATION PLATE AND IDENTIFICATION NUMBER

4.3.1 IDENTIFICATION PLATE OF THE MACHINE

The identification plate is attached to the front end of the frame of the machine. It includes the following information:

- name and address of the manufacturer,
- product type,
- model,
- maximum permissible working pressure,
- empty weight of the machine,
- permissible total weight of the machine,
- year of production,
- serial number and
- certificate of conformity.

4.3.2 IDENTIFICATION PLATE OF THE PUMP

The identification plate is attached to the pump and it includes the following information:

- name and address of the manufacturer,
- sprayer type,
- denominated flow,
- maximum flow at a maximum permissible rotational frequency (rpm) of the pump and a maximum permissible working pressure,
- necessary driving power,
- type of oil in the pump and
- serial number of the pump.

4.3.3 IDENTIFICATION PLATE OF THE SPRAYING BOOM

The identification plate is attached to the middle part (shoulder) of the spraying boom and it includes the following information:

- name and address of the manufacturer,
- product type and model,
- working width,
- maximum permissible working pressure,
- weight,
- year of production and
- serial number.

When ordering spare parts, all of the information written on the identification plate must be given to the seller.
4.4 FUNCTION SCHEME (AGS 200EN, AGS 300EN, AGS 400EN/L)

1. Three-way selection valve with release
2. Three-way selection valve
3. Suction filter
4. Pump
5. Pressure regulator
6. Mixing nozzle feeding valve
7. Valves that open individual sections for spraying
8. Main reservoir
9. Selection valve
10. Ablution reservoir
11. Clean water reservoir (to wash hands)
12. Pouring sieve
13. Nozzles
14. Mixing nozzle
15. Manometer
16. Nozzle for tank ablution

4.5 ADDITIONAL EQUIPMENT

There is a long list of additional equipment for your sprayer which will make operation of it even easier:
- valve for cleaning of the packaging (liquid agents);
- ablution of the insecticide in the sieve;
- TRIGET nozzle insert holders;
- nozzle inserts LECHLER, ALBUZ, TEEJET;
- suction basket with a 5 meter long suction hose;
- washing of the main reservoir.
5 HOW TO CONNECT THE SPRAYER TO THE TRACTOR

Sprayers were designed for connecting to the tractor’s three-point connection system class I (pintle diameter 28 mm). Mount the sprayer in the tractor’s three-point connection system and secure it with the pins. After that, lift the sprayer to a height where both the connection of the tractor and the sprayer are on the same height and connect them with the cardan shaft.

WARNING: Please consider the weight of the sprayer. Be very careful when lifting a full sprayer for the first time!

We recommend doing the following:
- increase the air pressure in the tyres (see the instructions for use of the tractor);
- make sure that the pressure regulator does not hit the tractor’s cabin or any other part of the tractor;
- make sure that the tractor and the pressure regulator are not touching;
- if necessary, attach some weights to the front of the tractor (see the instructions for use of the tractor);
- slow down when driving with a full reservoir (the possibility of breaking the reservoir will become smaller).
6 MOUNTING OF THE DRIVE SHAFT (CARDAN SHAFT)

6.1 OPERATOR’S SAFETY

To avoid possible accidents and personal injuries please follow the instructions and recommendations written below:

- Before mounting (connecting of the cardan shaft to the tractor and the sprayer) the drive shaft – cardan shaft, **always turn off the engine and remove the start key from its lock.** When mounting the cardan shaft, the cardan shaft of the tractor can be easily turned if the engine and the cardan shaft are turned off.
- When mounting the cardan shaft make sure that the safety pin is in right position and well stuck in its hole. Pull and push the cardan shaft forwards and backwards as long as the safety pin is not in its hole.
- Rotating shafts can be very dangerous!
- Always make sure that all of the safety devices are on their place and that all of the rotating surfaces are well covered, including the “junctions” of the cardan shaft on both ends! Do not use cardan shafts without having secured them!
- Do not touch rotating cardan shafts! The safety distance to a rotating cardan should not be less than 1.5 m.
- Protect the protection devices against turning by means of the chain!
- Make sure that the protection of the cardan on the tractor is well connected (attached)!
- Always turn off the engine and remove the start key from its lock before starting maintaining the machine or connecting the cardan shaft!

6.2 CONNECTION OF THE CARDAN SHAFT

The first mounting of the cardan shaft should be performed as follows:

1. Mount the sprayer to the tractor and lift the tractor’s lift arms to such a height, where the distance between the tractor’s connection shaft and the sprayer’s connection shaft is the **shortest (both connection shafts are on the same height).** Be careful not to hit the sprayer against the tractor or the ground.
2. Stop the tractor’s engine and remove the start key from its lock (starting).
3. Connect the short exiting cardan shaft of the tractor with the short cardan shaft of the SPRAYER by means of the cardan shaft.
4. In the case the cardan shaft is too long and needs to be shortened, pull out the cardan shaft and mount each end of it separately to the shaft of the tractor and to the shaft of the SPRAYER, measure it out and mark the place where it needs to be cut.

**WARNING:** the mutual covering of both cardan shafts must be at least 150 mm.
5. Uporabite priložen alat, da zmanjšate oba delova na isti način in po potrebi odstranite švarno.
6. Uporabite profily in spojite oba delova karadanškega čela.

7. Namestite karadanško čelo na traktor in stiskalo.

8. Da bi zagotovili dolgo trajnost karadanškega čela, izvučite vse elemente, ki so več kot 15° (slika 8.4).

7. PODROBNA PRIZORNA OPIRANJE IN UPUTE ZA UPORABO

Pomembno: Vsi elementi, ki so več kot 15° (slika 8.4), morate odstraniti.

Kamna je izdelana iz otopljenine, ki je odoljavačja proti kemikalijam. Obstaja iz enoto, ki se razširja na spodnjo stran, enoto, ki se razširja na zgornjo stran, enoto, ki se razširja na levo stran, enoto, ki se razširja na desno stran, enoto, ki se razširja na sprednjo stran, enoto, ki se razširja na zadnjo stran.

7.1 Glavni rezervoar

Glavni rezervoar je izdelan iz otopljenine, ki je odoljavačja proti kemikalijam. Obstaja iz enoto, ki se razširja na sprednjo stran, enoto, ki se razširja na zadnjo stran, enoto, ki se razširja na levo stran, enoto, ki se razširja na desno stran.

Pomembno: Uporabite zaščitne rokavice pri obravnavah kemikalij!
7.1.1 RESERVOIR COVER AGS 200
A single piece cover with a size of Ø230 mm has a small hole in the middle for ventilation. The cover can be opened by turning it to the left and closed by turning it to the right. While operating the machine, the cover must remain closed.

7.1.2 RESERVOIR COVER AGS 200EN, AGS 300EN, AGS 400EN/L
The cover consists of two parts. The smaller in the middle of the reservoir is meant for easier filling of water. It is recommended to use clean water. The cover can be opened by turning it to the left and closed by turning it to the right. While operating the machine, the cover must remain closed.

If the cover on your reservoir is similar to that displayed on the picture below, never put the hose through the opening in the top into the reservoir or do not allow the hose to touch the insecticide, since it can get contaminated! The pressure in the hose can drop and suck in some of the insecticide.

This also applies to the cover of a sprayer type AGS 200.

7.2 ABLUTION RESERVOIR (AGS 200EN, AGS 300EN, AGS 400EN/L)
The ablution reservoir is meant for washing of the reservoir and other elements after you have finished working or after a break. Fill the reservoir with clean water. You can find more detailed instructions in the chapter "DESCRIPTION OF VALVE ADJUSTMENT FOR SPRAYING OR CLEANING".

7.3 RESERVOIR FOR WASHING OF HANDS (AGS 200EN, AGS 300EN, AGS 400EN/L)
This reservoir is meant for washing of hands after handling insecticides. Fill the reservoir with drinkable water. Its capacity is 12.5 litres.

The water is not drinkable!
7.4 MIXING NOZZLE

The sprayer is equipped with one or two mixing nozzles for better mixing of the mixture. The nozzles are mounted in the lower part of the reservoir. The mixing nozzle is controlled by means of the valve which is mounted on the pressure regulator. The mixing nozzle is operating when the lever of the valve is in upright position and vice-versa. It is recommended to turn on the mixing nozzle during insecticide preparation and driving to the field.

7.5 THREE-WAY VALVE-EJECTOR

A three-way valve, also called ejector, with a built in filter insert and an attachment that allows pumping of water into the main reservoir from lakes, ponds or other watercourses, is installed on the bottom side of several more basic types of sprayers (with a BM 65/30 pump and without additional reservoirs).

7.5.1 THREE-WAY VALVE FUNCTIONS (SEE PICTURE)

1. LEVER IN THE INNER POSITION.
In this lever position, the outflow of insecticide from the reservoir is closed. It is possible to fill the reservoir by attaching the suction hose with a basket (020.20.018) to the suction attachment (019.01.032) and pumping water from lower-lying positions (a stream, a fountain). Suction hose with the suction basket is not a part of machine's standard equipment.

2. LEVER IN THE CENTRAL POSITION
Release of water from the reservoir is enabled, if the three-way valve is installed under the reservoir.

3. LEVER COMPLETELY DRAWN OUT
Normal operation: the pump is extracting water from the reservoir through the filter insert in the three-way valve.

7.5.2 CLEANING THE FILTER INSERT

It is recommended to clean the filter insert of the three-way valve before each refuelling of the reservoir. To access the insert, pull out a pin (019.36.314) and an outlet insert (019.01.030). Wash the filter insert with running water and slide it back into its place in the ejector. As the insert has a conical shape, make sure you insert it correctly. The wider end should be inside the valve body.
If it is necessary to clean the filter insert when the reservoir is full, push the lever into inner position before dismantling it, so that outflow from the reservoir will be closed.
7.6 SUCTION FILTER
The suction filter is mounted between the reservoir and the pump. Its function is to filter the insecticide before it reaches the regulator. Density of the filter is 50 MASH.

7.6.1 CLEANING THE FILTER INSERT
Firstly, unscrew the yellow lever (3) on the filter cover (2) by turning it counter clockwise and pull it out. The valve mounted inside the filter will close the flow of the liquid from the main reservoir. Unscrew the nut (5) from the filter cover and remove the cover and the filter insert (4). Clean the filter insert and mount all parts back together in the opposite order. When mounting the parts back together, make sure that the metal pin of the locking valve, which is located at the extracted part (with a yellow handle) will be properly inserted, otherwise the filter will not function properly.

![Diagram of suction filter and filter insert]

**WARNING:**
Use protective gloves while cleaning the filter! Clean the filter insert every time before filling the reservoir!

7.7 DESCRIPTION OF VALVE ADJUSTMENT FOR SPRAYING OR CLEANING

7.7.1 SPRAYING
Empty the main reservoir (8) by opening the three-way valves (1) and (2) and let the insecticide flow through the filter (3) and the pump (4) to the pressure regulator (5). Open the valve for insecticide mixing (6) and for individual nozzle sections (7).

The flow direction of the three-way valve is shown on the valve lever by means of an “arrow”. The selection valve (9) needs to be adjusted in such way that the liquid excess is diverted from the regulator to the main reservoir. You can find a more detailed description of the regulator in chapter “The flow regulator PR3”.
7.7.2 COMPLETE CLEANING OF THE SPRAYER

The complete cleaning if the sprayer includes the cleaning of all inner parts of the sprayer: the reservoir (8), the filter (3), the pump (4), the regulator (5), the nozzles (13), etc. Switch the three-way valve (2) to the ablation reservoir (10). Direct the clean water from the reservoir (10) through the pump (4) into the pressure regulator (5). By opening the valves (6 and 7) you enable water to flow to the nozzles and to the mixing nozzle (14). The flow from the pressure regulator through the selection valve (9) should be directed into the main reservoir. At the end of the process, switch the three-way valve (2) to the main position and empty the reservoir through the nozzles (13).

7.7.3 PARTIAL CLEANING OF THE SPRAYER

The partial cleaning of the sprayer includes the cleaning of the filter (3), the pump (4), the pressure regulator (5) and the nozzles (13) without changing the concentration of the insecticide in the main reservoir.

Switch the three-way valve (2) to the ablation reservoir (10) and change the flow directly to the pump (4) by means of the selection valve (9). Close the mixing valve (6) by means of the pressure regulator (5) and, if needed, the return line from the pressure filter, too. The clean water can now easily flow through the filter (3), the pump (4), the pressure regulator (5) and through nozzles (13) whereas the concentration of the insecticide in the main reservoir remains the same.

8 ADDITIONAL EQUIPMENT

8.1 WASHING OUT OF THE INSECTICIDE IN THE SIEVE

This additional equipment assures an easier insecticide handling. There is a nozzle mounted in the sieve which directs the flow of the liquid to the bottom of the sieve and, in this way, washes of the insecticide in the sieve. The nozzle includes an additional direction control valve which is additionally mounted on the flow regulator and a hose connection between the valve and the nozzle. The nozzle is operating when the valve lever is in upright position and vice-versa (see chapter 9.5).
8.2 SET FOR OUTER CLEANING OF THE SPRAYING APPLIANCE

After finished working the spraying appliance needs to be cleaned. The most appropriate place for cleaning is at the edge of the surface where you have had just finished operating the machine. For this purpose, a set for external cleaning of the spraying appliance is a big help.

The set includes:
- a spraying stick
- a flexible hose and
- an accessory part for connecting the spraying stick to the pressure regulator.

The accessory part needs to be mounted on a free valve of the pressure regulator (if the spraying appliance has a free section mounted) or a section on the pressure regulator needs to be disconnected (e.g. the mixing nozzle) and connect the spraying stick to the spraying appliance.

Other parts of the spraying appliance need to be set the same as for partial cleaning of the sprayer (see chapter 7.6.3).

8.3 VALVE FOR WASHING THE PACKAGING

The valve for washing the packaging is intended for washing the packaging of used liquid chemical agents. The valve is mounted inside the reservoir, near the pouring sieve or at the bottom of the pouring sieve. It is connected to the direction control valve at the flow regulator by means of a hose (mostly in combination with the mixing nozzle). If you wish to wash an empty packaging you will need to open it, push it over the nozzle to the limiter and then push it together with the limiter towards the wall of the reservoir or towards the bottom of the pouring sieve. When doing that, the valve that supplies the rotating nozzle will open and thoroughly clean the packaging. When you will remove the packaging, the valve will close the flow of the liquid.

**WARNING:** Use protective gloves when handling insecticides!
8.4 SUCTION BASKET WITH A SUCTION HOSE

The suction basket is meant for sucking of water out of ponds, streams, fountains, etc. through the filter, the pump and the regulator into the main reservoir. It consists of the suction basket, 5 meters of suction hose and a connection piece for the filter.

8.4.1 CONNECTING THE SUCTION BASKET TO THE EJECTOR (AGS 200)

If you are using water from natural sources you have to be extremely careful, because incorrect handling during filling may lead to their contamination (the contents can flow out of the reservoir). Therefore it is important for you to follow the instructions for proper handling of a three-way valve, described in chapter 7.5.
8.4.2 CONNECTING THE SUCTION BASKET TO THE EJECTOR (AGS 200EN, AGS 300EN)

The connection piece is mounted to the suction filter in this way: remove the yellow lever and mount the connection piece that is attached to the suction basket instead of the yellow lever. Stretch the suction hose and plunge the suction basket into water. While doing this, be aware that deeper you sink the suction basket the more this affects the membranes in the pump. The height difference between the pump and the suction point should not be bigger than 3 metres. Before turning on the pump switch the lever of the central valve 2 (see chapter “SETTING OF THE WORKING REGULATOR”) to the position “Z” and close the three-way valve at the exit of the reservoir (outflow of the reservoir). The water flow is now directed from the suction basket to the suction filter, the suction pump and the flow regulator (return line) into the reservoir.

8.5 MARKER

By using the marker, the foamy tracks, which are created by the marker, can be a great help, since they define the border of the previous spraying. The foam is created with a proper mixing of air with a mixture of water and liquid detergent. The appliance makes white foamy points (diameter 10-20 cm) every 5-20 seconds (depending on the setting) and by this it creates a line, which marks the border of previously sprayd surface.

8.5.1 MOUNTING

Mount the reservoir for liquid detergent (1) to the side of the reservoir, the compressor block (2) to the rear side of the sprayer between the guides of the spraying boom. The mixing nozzles (3) of the marker must be attached to the end of the spraying boom and the control box in the cabin of the tractor. The connecting tubes must be guided along the spraying tubes of the spraying boom and connected to the ties, but make sure the tubes will not be overstretched, as that could damage them. The tubes must allow you to normally handle the spraying boom.
8.5.2 INSTRUCTIONS FOR USE
Since the marker is not a part of the sprayer’s standard equipment, you can find detailed instructions for use in a separate booklet "MARKER-INSTRUCTIONAS FOR USE AND MAINTENANCE".

8.6 WINDER REEL WITH STICK FOR MANUAL SPRAYING (ADITIONAL EQUIPMENT)
On sprayer you can mount winder reel, with spraying stick. The accessory part needs to be mounted on a free valve of the pressure regulator, or you just disconnect one of the spray section, and connect this free valve with the tube of the winding reel.

8.7 LIGHTS SIGNALISATION
Lights are mounted to the rear side of the spraying boom. They are equipped with luminous boards (RED-WHITE), rear lights with a reflective triangle and two white reflectors, which are mounted to the front side of the boom. Connecting cable with a plug is guided to the tractor cabin. Elements of lights signalling are shown in the figure below.
9 FLOW REGULATOR

9.1 THE FLOW REGULATOR PR3

The flow regulator PR-3 is meant for precise regulation of the working pressure from 0-12 bars. The basic version of the flow regulator PR-3C consists of a regulation valve, a central valve with vacuum anti-dripping system and direction control valves. The improved version PR-3B has direction-control-regulating valves mounted instead of direction control valves, which enables you to precisely set the operating pressure in individual sections of the spraying boom. The regulator is also equipped with a self-cleaning pressure filter.

9.1.1 REGULATOR MARKING

The basic marking PR-3C and PR-3B can be given an additional letter F which stands for the self-cleaning pressure filter. The number of direction-control-regulating valves and direction control valves is marked with a numeric code (the first number marks direction-control-regulating valves and the second marks direction control valves).

For example:
The marking PR-3BF/5+1 stands for the regulator PR-3B with the self-cleaning pressure filter, five direction-control-regulating valves and one direction control valve.

9.1.2 REGULATION AND CENTRAL VALVE

The regulation valve is meant for precise working pressure regulation from 0-10 bars. By turning the regulation nut to the right you can increase the working pressure; by turning it to the left you can lower the working pressure. The central valve can be closed and opened by turning the lever 2. When the lever points to the left (position O) the flow to the direction control valves is opened, by turning it to the right (position Z), the flow to the direction control valves is closed. By turning the lever to the right, the return line and the vacuum anti-dripping system are activated.

9.1.3 SELF-CLEANING PRESSURE FILTER

The self-cleaning pressure filter additionally cleans the insecticide before this is sprayed through the nozzles. Small parts that get caught in the filter insert (density M 50) are sent back to the reservoir through the valve mounted at the bottom of the filter (a) when cleaning the filter insert. During operation the filter must remain closed.

However, when using pumps with larger flows, you can disburden the regulator by opening the valve (a) on the filter bottom, but you must be careful as it could happen that you won't be able to achieve the required spraying pressure. In such an event you must close the valve or at least turn it down to such an extent, that pressure in the sistem will rise to the required limit.

Periodical cleaning of the filter is performed by opening the valve (a), so a part of the flow is redirected back to the main reservoir.

A thorough cleaning of the filter must be performed after spraying. You can find the precisely described procedure in a separate chapter.

WARNING: Since an opened valve can cause huge pressure drops when using less powerful pumps or nozzles with a higher flow, it is recommended to close the valve in such a case.
9.1.4 DIRECTION-CONTROL-REGULATING VALVE "B"

Direction-control-regulating valves assure a constant working pressure regardless of how many direction control valves or how many segments of the spraying boom are opened. By switching the valve lever (1) to the position (a) you open the insecticide flow to the nozzles. By turning the lever to the position (b), you close the insecticide flow to the nozzles but open the return valve. Correctly adjusted return valve returns the same amount of insecticide to the reservoir as the nozzles would use when the lever is in position a.

The return valve can be adjusted with the help of the nut (2). These valves are included in the regulator PR-3B.

9.1.5 DIRECTION CONTROL VALVE "C"

Direction control valves are used as valves for closing and opening of individual sectors of sprayer booms with smaller working widths and for opening and closing the system that is responsible for continuous mixing in the main reservoir.

They can also be used as valves to feed the assemblies that are parts of sprayers' optional equipment.

All types of PR3 flow regulators are equipped with these valves.
9.1.6  **SETTING OF THE WORKING REGULATOR**

1. Always perform the setting with clean water!
2. Calculate the required working speed concerning the insecticide consumption per hectare and the flow through nozzles.
3. Adjust the tractor’s rpm in accordance to the calculated working speed;
4. Open all of the direction-control-regulating valves (4) and the mixing valve (3).
5. Open the central valve.
6. Adjust the working pressure.
7. Adjust the return valve on direction-control-regulating valves.
   - Close the first direction-control-regulating valve. The working pressure will change according to the manometer.
   - Level the working pressure by turning the regulation nut on the first valve.
   - Level all of the other direction-control-regulating valves in the same way.
8. The return valves will need adjustment when changing the nozzles.

9.2  **MAINTENANCE OF THE PRESSURE REGULATOR**

**After every single spraying the regulator needs to be washed with clean water.** The rests of the insecticides can gnaw through sealings and shorten the durability of the regulator. The easiest way of cleaning the filter is to open the valve on the filter and close all of the direction control valves and let the water flow through the filter. Clean the filter insert by hand from time to time and replace it if it is worn or damaged. To do this, turn the lower part of the filter (E 14022/1) in counter clockwise direction, pull out the filter insert E (14021) and clean the inside of it with a brush and flowing water. Before reassembling the filter also clean the seal and its place and grease the seal. This applies to all junctions where round sealings are used.

Oil all of the moving parts and threads of the regulator every 40 working hours. Thoroughly clean and grease the “0” sealings before connecting the connecting parts together. When assembling the parts, slightly turn the attachment in order not to damage the seal.

Empty the reservoir during winter.

**WARNING:** Use protective gloves while cleaning the regulator!
10 PUMPS

Pumps are a vital element of spraying appliances. The reliability and a long durability of the pump also depend on how you treat the pump and whether you use and maintain it correctly.

**IMPORTANT:** The standard version of all pumps is equipped with membranes which are made of NBR rubber. Therefore it is the user’s duty to use only chemical agents for spraying which do not harm this kind of material. On the opposite, the manufacturer can not be held responsible for any kind of damage that could occur.

**10.1 CHECK BEFORE USING THE APPLIANCE**

When the pump is not operating check the oil quantity in the housing of the pump. Also check the oil level every single time before filling the reservoir. The level must be within the limits which are marked on the oil lid or in the oil pot (depends on the version of the pump). If the oil level is too low add some oil whereas be careful not to exceed the maximum allowed level.

![Diagram showing air pressure in the air chamber.](image)

The air pressure in the air chamber depends on the working pressure which can be found in the diagram on the left. The air pressure in the air chamber must never be higher than the working pressure of the pump.

Make sure that the valves ensure free flow of liquid from the reservoir to the pump. Also check the porousness of the suction filter insert and the suction hose (make sure that the hose is not folded).

**10.2 USE**

Before turning on the pump make sure that the main valve is switched to position “Z” (see chapter “REGULATION AND CENTRAL VALVES”).

Never turn on the pump’s drive when the setting on the regulator enables full stressing of the pump.

Turn on the pump and let it run for approximately one minute under minimum pressure in order to aerate the pump and the inlet and the outlet pipes. After one minute the pump is ready for operation. Be careful not to exceed the maximum allowed pressure and the maximum allowed rpm of 540. On the opposite, the manufacturer can not be held responsible for any kind of damage that could occur.

**10.3 AFTER USE**

Some chemical agents can shorten the durability of some vital parts of the pump such as rubber membranes and/or other rubber sealings. Therefore a thorough washing of the pump after every single spraying is recommended. To do this, you will need to pump some clean water through the pump. Let the pump operate at working pressure for several minutes. Lower the pressure and let the pump operate for approximately one minute to blow out the rest of the liquid (blowing out the pump).

During winter, leave all of the water out of the pump and/or protect the pump against freezing (see chapter “MAINTENANCE AND STORAGE AFTER USE”).
10.4 PISTON MEMBRANE PUMPS BM 40/25, BM65/30 AND BM 105/20

Type BM 40/25, BM 65/30 and BM105/20 pumps are low-pressure piston membrane pumps, made of materials that have been tested by the factory. The pumps are suitable for pumping of insecticides or liquid fertilizers which are used in farming.

10.4.3 OIL CHANGE

Change the oil for the first time after the first 10-20 working hours and after that every 300 working hours. Also check the membranes when changing the oil. Replace damaged or worn membranes with new ones. It is recommended to change the membranes every 300 working hours.

Membranes check for BM 40/25: To check the membranes, first unscrew the bolts 019.31.317 then remove the side chambers 019.41.014. Carefully inspect the upper and lower side of the membranes and release the oil at the same time.

Membranes check for BM 65/30: To check the membranes, unscrew the bolts (019.07.031) on the lower fork, release the suction collector (016.20.008) and the air chamber (018.30.004). Than unscrew the bolts (019.31.305) of the pump chamber (017.03.002) and remove the chambers. Carefully inspect the upper and lower side of the membranes. Release the oil at the same time.
Membranes check for BM 105/20: To check the membranes, first of all unscrew the bolts (540015) on the covers of the pump 017.41.007 and release the suction and pressure collector. After that, unscrew the bolts 019.31.317 on the covers 017.41.007 and remove the chambers. Carefully inspect the upper and lower side of the membranes. Release the oil at the same time.

WARNING: Make sure that the worn oil is poured into appropriate tanks! Do not discard worn oil in nature!

It is recommended to clean the inside of the pump and its vital parts with diesel oil before reassembling the pump. Assemble the pump in the opposite direction. Be careful to correctly insert the valves (see the catalogue). After that, pour fresh oil into the pump. For pumps type BM 40/25 and BM 65/30 oil needs to be poured in through the hole of the oil lid (019.01.101). For pumps type BM 105/20 oil needs to be poured in through the oil pot (017.01.142).

While pouring oil into the pump, turn the shaft of the pump several times by hand in order to press out any excess air which is caught between the piston and the membrane. Pay attention to the oil level.

Turn on the pump for few minutes at minimum pressure. Pay attention to the functioning of the pump and add some oil if needed.

What to do in case of a damaged membrane: If the oil in the oil pot (BM 105) whitens or the oil lid (019.01.101) falls off of type BM 40/25 or BM 65/30 pumps, immediately stop operating the machine and replace the damaged membranes. On the opposite, the pump can be heavily damaged. It is also possible to recognise a damaged membrane by means of the manometer, since its pressure pointer does not come to a halt.

Maintenance: After every single use, it is recommended to wash out the inside of the pump as well as other parts of the SPRAYER with clean water.

11 SPRAYING BOOMS

Sprayers can be equipped with spraying booms, namely:
- 6M - standard width of 6 m. Standardly divided into 3 spraying segments.
- 8M - standard width of 8 m. Standardly divided into 3 spraying segments.
- 10M - standard width of 10 m. Standardly divided into 3 spraying segments.
- 12M - standard width of 12 m. Standardly divided into 3 spraying segments.

These spraying booms are simple and robust constructions, with a manual method of opening and closing from the transport into working position and vice versa. They are attached to the supporting frame of the sprayer with the help of threaded fasteners. Working height can be adjusted depending on the type of nozzles and the height of crops with help of manual height shifting.

All spraying booms are equipped with bayonet nozzle holders with a membrane anti-dripping system and fissure nozzles with flattened jet LECHLER - ST. Distance between nozzles is 0.5 meters.

IMPORTANT: after changing any settings make sure the the nuts on the fastening screws are securely tightened.

LUBRICATION: After approximately 40 working hours lubricate all moving parts of the spraying boom. If you are cleaning your SPRAYER with a high-pressure cleaning appliance, we recommend you lubricate it after every cleaning.
11.1 SETTING THE WORKING HEIGHT OF YOUR SPRAYING BOOM

Spraying booms types 6M, 8M, 10M and 12M are attached to the sprayer with 4 screws. Working height the spraying boom can be adjusted depending on the type of nozzles and the height of crops with help of manual height shifting. By loosening the screws you can raise or lower the spraying boom to the appropriate height and then re-attach it to the supporting rail with the mounting holes.

11.2 SPRAYING TUBES

Shapes and designs of the spraying tubes (PE), used in spraying booms are shown in the picture below.

They are marked with the numeric code.
Example: spraying tube 2/2
11.3 NOZZLE HOLDERS

11.3.1 MEMBRANIC NOZZLE HOLDER

Single nozzle holders with nozzle mouthpieces inside them are a part of standard equipment of spraying booms. A nut (1), with a different shape for different types of nozzles, is used to attach the nozzle mouthpieces. Nozzle components are listed in the catalog of spare parts. An integral part of the holder is also a membranic anti-dripping valve (2), which prevents dripping of solution form the nozzles during the suspension of spraying.

11.3.2 NOZZLE HOLDERS (ADDITIONAL EQUIPMENT)

As additional equipment you can mount different nozzle holders on the spraying booms. Each of these nozzle holders contains three different nozzle mouthpieces:

➢ Up to year 2011 – TRI GET
➢ From year 2012 – TRI JET

They are attached with nozzle nuts (1), with different shapes and colours for different types of nozzles. By rotating the lower part of the holder you can easily switch between nozzle mouthpieces and choose the one that is appropriate for a given spraying operation. These holders are also equipped with a membranic anti-dripping valve (2), which prevents uncontrolled dripping from the nozzles. Nozzle holder components are listed in the catalog of spare parts.

11.4 MAINTENANCE OF SPRAYING BOOMS

Periodically check screws and bolts, pins and especially safety pins, their tightness and their condition. Tighten or replace them if necessary.

⚠️ IMPORTANT: make sure that you have attached and tightened the nuts of the adjustment bolts after adjusting the spraying boom.

GREASING:

Grease all moving parts of your spraying boom after every 40 working hours. In the case your spraying boom is being cleaned by a high-pressure cleaning appliance, it is recommended to grease all parts after every single cleaning. After washing the spraying boom, check if any of the hoses or joints leaks and check the condition of the flexible hoses. Repair broken hoses or loose joints at the right time, since that kind of errors can cost you a lot of time during spraying. Some insecticides contain solvents which affect the paint. Clean the corrosion of colourless parts of the spraying boom and apply some new paint.
11.5 HOW TO CLEAN THE SPRAYER

After every single use of the sprayer, the appliance must be thoroughly cleaned. The best way to use any excess insecticide is to dilute it with water and spray it on the same surface again. The concentration should be at least 10% (10 units of water per one unit of insecticide), the spraying speed slightly faster and the spraying pressure slightly lower (1.5 bar, depending on the nozzle). While doing this, use the additional reservoir for washing. The procedure is described in the chapter “COMPLETE CLEANING OF THE SPRAYER”. After that, thoroughly clean the sprayer on the inside and the outside and also clean all tolls which you have used for spraying (including the tractor). Use only detergents that are recommended by the manufacturer of protection agents! If there are instructions for cleaning of the appliance after using it attached to the instructions for using the insecticide, follow them.

In accordance with the local legislation on washing of the pesticides into the earth, agree on cleaning of your sprayer with your advisory service.

The ablation of pesticides (cleaning of the sprayer) must not be performed on swampy ground or in the near of streams, water dams, dykes or water fountains, etc.

If there is still some insecticide inside the sprayer and if you had to stop working unexpectedly for some time it is recommended to clean the pump, the regulator and the spraying lining with clean water (see chapter PARTIAL CLEANING OF THE SPRAYER).

In the case you had to stop working unexpectedly but did not clean the sprayer yet, you have to assure that other people or animals cannot reach the sprayer.

REMEMBER:
- Only a clean sprayer appliance is a safe appliance.
- A clean sprayer appliance is ready to be used.
- A clean sprayer appliance cannot get damaged by chemical agents or chemical solvents.

When cleaning the sprayer use appropriate protection clothes. Choose appropriate detergents for cleaning and, if necessary, appropriate insecticide neutralising agents (see recommendations of the insecticide manufacturer).

In the case you are using a mixture of detergent and water for cleaning, pour it into the main reservoir, close the main valve on the pressure regulator, turn on the pump, open the direction control valve for mixing, open the self-cleaning filter valve and only after few minutes open the direction control valves of the nozzles. Be careful when choosing the place for releasing of the cleaning agent. Some detergents become active only after few minutes, so the cleaning process can be slightly longer (see instructions of the manufacturer).

WARNING: Be careful while handling detergents; follow the instructions of the manufacturer!

After cleaning the sprayer with a detergent, fill the tank to at least 1/5 with clean water and repeat the cleaning process. Make sure that you have cleaned all elements that have come in contact with the insecticide or the detergent.

Make sure that you have precisely cleaned all filters. Be careful not to damage the fabric on the filter insert while cleaning filters. If the filter insert is damaged, replace it with a new one. A more precise description about cleaning of the pressure filter can be found in chapter 9.2, about cleaning the suction filter in chapter 7.6.1, and about cleaning the three-way valve-ejector in chapter 7.5.2.

At the end of the cleaning process, clean all nozzles. Nozzles can be cleaned only by means of a soft brush, compressed air or water. You can damage the nozzle when cleaning it with a hard item.

WARNING: In the case your spraying boom is being cleaned by a high-pressure cleaning appliance, it is recommended to grease all parts after every single cleaning!
11.6 MAINTENANCE AND STORAGE AFTER USE

When the spraying season is over, find some time and prepare the spraying appliance for storage. Before storing the appliance, thoroughly clean the inside and the outside of the sprayer (regulator, pump, sieves, selection valves, nozzles, etc.). When the cleaning is done make sure that there is no water left in the valves, the filters, the pump, the nozzles, etc. Do not maintain the sprayer until it has not been thoroughly cleaned.

11.6.1 HOSES

Check the tightness of all hoses and hose junctions. Replace damaged hoses with new ones. A damaged hose cost you a lot of time during spraying.

11.6.2 PAINT

Some insecticides contain solvents which affect the paint. Clean the corrosion of colourless parts of the spraying appliance and apply some new paint.

11.6.3 RESERVOIR

Make sure that there are no rests of insecticide inside the reservoir. Chemical agents must not stay in the reservoir for a long time, since they can fast shorten the durability of the reservoir and other parts. Make sure that the outflow valve is opened.

11.6.4 PRESSURE REGULATOR

Protect the pressure regulator against moisture and dust. It is recommended to grease moving parts with WD-40 or oil. There are further instructions about the maintenance of the regulator in chapter "MAINTENANCE OF THE REGULATOR".

11.6.5 PUMP

After every season, thoroughly clean the inside and the outside of the pump and prepare it for storage. Check the quantity of working hours and, if necessary, repair the pump (oil change, membrane change, sealing change, etc) or at least check the oil level, the sealing, etc. This is the most appropriate time of the season to perform some maintenance work. If you are not sure whether or not you can repair the pump on your own, leave the work to an authorized expert. You can find the description about maintenance work in the chapter "PUMPS".

11.6.6 DRIVE SHAFT-CARDAN

It is very important that the safety pin, which is attached to the head of the cardan shaft, is clean and greased. This assures that the shaft is safe to use. Check the protective cover, the functioning and the condition of the cardan shaft every 40 working hours. Replace damaged parts with new ones. Check the protective cover of the cardan shaft every 100 working hours and, if necessary, replace the sliding plates of the protection. Also check the condition of the cardan shaft. Pay special attention to the safety pin. Replace damaged parts with new ones.

11.6.7 BOLTS

IMPORTANT: Check the bolts, pins and especially safety pins, their tightness and their condition. If necessary, tighten or replace them.
11.6.8 HOSE JUNCTIONS

Reasons for bad sealing of hose junctions:
- missing O-rings or sealings;
- damaged or poorly inserted sealings;
- dry or re-formed sealing or O-ring;
- unsuitable joints;

In the case of bad sealing or leaking:
DO NOT TIGHTEN the joint too hard, since you can easily damage it. Take the joint apart and check the condition and position of the sealing or the O-ring, clean and grease it and reassemble the joint.
Use only non-mineral grease (bio-grease) for greasing.

REMEMBER:
- it is sufficient to tighten the joint by hand (radial sealing);
- it is sufficient to tighten the joint by a hand tool (axial sealing).

11.6.9 OTHER PARTS

The rest of the vital parts such as filter inserts, pouring sieve, additional equipment, etc. must be thoroughly cleaned, checked and replaced if necessary, too. Remove the remaining water and eventual sediments from parts such as suction filters and three-way valves. Grease all moving and sliding parts of the sprayer.

WARNING: If the temperatures get below zero, protect the spraying appliance against cold, which could damage it!

To protect the appliance against cold, follow the instructions written below:
- either remove all water from the pump, the regulator, the hoses, the filters and other elements of the sprayer;
- or store the spraying appliance in a warm room;
- or use an agent against freezing (antifreeze) in accordance with the following procedure:
After you have finished cleaning the spraying appliance, completely empty the reservoir and pour at least 10 litres of antifreeze agent (a mixture of water and antifreeze) and turn on the pump. Open all valves on the regulator in order the antifreeze agent can reach all hoses and nozzles. At the end, empty the remaining agent from the reservoir into the tank and let the pump operate for few more minutes in order to pump the remaining agent into the reservoir and the container.

WARNING: Make sure that the antifreeze agent is poured into appropriate tanks! Do not discard antifreeze agents in nature.

Protect the manometer against freezing by unscrewing it from the regulator and storing it in a warm room. The manometer must be stored in an upright position; on the opposite the glycerine filling can flow out of it.
# 12 POSSIBLE ERRORS

<table>
<thead>
<tr>
<th>SIGNS FOR ERROR</th>
<th>POSSIBLE REASON</th>
<th>CHECK / REPAIR</th>
</tr>
</thead>
<tbody>
<tr>
<td>There is no liquid coming out from the nozzles even though the main valve on the flow regulator is opened.</td>
<td>- damaged or incorrectly inserted valves in the pump; - closed manual valve on the suction side; - the suction or pressure filter is clogged; - there is some air inside the suction line.</td>
<td>- check and if necessary replace valves in the pump; - check the valves on the suction line to the pump; - clean or replace the filter insert; - check the tightness of the hose junctions on the suction side.</td>
</tr>
<tr>
<td>The insecticide jet is unsymmetrical.</td>
<td>- inappropriate pressure in the air chamber.</td>
<td>- check the air pressure in the air chamber and fill it according to the data from chapter 11.1.</td>
</tr>
<tr>
<td>The pressure is falling according to the manometer; the working pressure can not be reached.</td>
<td>- the suction or pressure filter is clogged; - the pressure hose is broken; - the valve of the self-cleaning filter is opened; - incorrectly chosen or too worn nozzle inserts;</td>
<td>- clean or replace the filter insert; - replace the hose; - close the valve of the self-cleaning filter; - check the flow rate through the nozzles – if it is bigger than 10%, replace the nozzles;</td>
</tr>
<tr>
<td>The pressure on the manometer is strongly swinging.</td>
<td>- there is some air inside the suction line; - the membranes are damaged.</td>
<td>- check the tightness of the hose junctions on the suction side; - stop the pump immediately; - replace the membranes and the oil inside the pump;</td>
</tr>
<tr>
<td>The pump is noisy.</td>
<td>- too low oil level; - exceeded maximum rpm</td>
<td>- control the oil level and add some if necessary; - control the rpm of the pump.</td>
</tr>
<tr>
<td>There is some insecticide in the oil of the pump.</td>
<td>- damaged membranes.</td>
<td>- stop the pump immediately; - replace the membranes and the oil inside the pump; - before mounting new membranes, thoroughly clean the inside of the pump with diesel oil.</td>
</tr>

13 TECHNICAL DATA

13.1 CHARACTERIZATION

The spraying appliances are characterised as follows:
For example: AGS 300 EN; BM 105; PR3 BF/5+1; 12M/3

AGS................ abbreviation for spraying appliances
300................ nominal capacity of the reservoir
EN.................. version
BM 105.......... pump type
PR3 BF/5+1..... regulator type
12M/3.......... working width of the boom, boom type / number of sections

All other technical data for individual components (pumps, flow regulator) can be gained from individual chapters.

13.5 CONNECTION FOR FLOW RATE MEASURING OF THE PUMP

The flow meter can be connected to the return line of the flow regulator. Remove the hose attachment (code E 19016 – see the picture in the catalogue “FLOW REGULATOR PR-3”) and mount the regulator to its place which is connected through the flow regulator into the reservoir. The attachment with an appropriate sealing is enclosed with the sprayer.

13.6 CONNECTION FOR PRESSURE MEASURING

The connection for the control manometer has a thread R ¼”, which can be found at the upper side of the regulation valve on the pressure regulator (see the picture in the catalogue, “REGULATION VALVE PR-3”).

To connect the manometer to the regulator, unscrew the cap (code E 15783) and screw the manometer into the thread.
13.7 MEASUREMENT OF LIQUID FLOW RATE THROUGH THE NOZZLE

To measure the liquid flow rate through the nozzle, you will need a piece of soft flexible hose with an inner diameter of 25 mm or 1” and an appropriate container (it is recommended to use a measuring cylinder). Simply put on the hose on the nozzle and measure the liquid flow rate by catching the liquid of individual nozzles into the measuring cylinder. You will also need a stopwatch or a wristwatch. The measurement time is one minute. If you have performed the measurement in less than one minute, calculate the liquid flow rate to one minute.

If the liquid flow rate of a nozzle at a specific pressure exceeds the table values for more than 10% than the nozzle insert is worn and needs to be replaced.

13.8 DISPOSAL OF THE SPRAYER

Once the spraying appliance can not be used anymore, you will have to clean it completely, take it apart and sort the individual components of the sprayer by material. The components must be handed over to an organisation which deals with waste materials. The reservoir and other plastic parts of the sprayer can be recycled or burned in special incineration sites. The metal parts can be sorted out as scrap metal. Consider the local legislation for waste materials.

13.9 MATERIALS AND RECYCLING

RESERVOIR…..PE HD (polyethylene of high density)

13.10 FLEXIBLE HOSES…..RUBBER, PVC

FRAME …..STEEL
VALVES, REGULATOR, NOZZLE HOLDERS ..... more or less PA with fibre glass
NOZZLE HOLDER HOSES .....PE (polyethylene)
13.11 GENERAL INSTRUCTIONS FOR SPRAYING

For a successful spraying, the appropriate water quantity, right nozzle selection and a precise consumption calculation are of major importance. It is recommended to stick to the following order when it comes to preparing of the spraying mixture and spraying:

Make sure that the spraying appliance is in flawless condition. Check the oil level of the pump and clean all filters.

Read the instructions which are attached to the protective agent. Pay special attention to the prescribed concentration, the dose for a hectare and the recommended water consumption.

Choose an appropriate tractor speed and – if you happen not to have a reliable value – measure it. It is very important to have precise speed values when it comes to calculation of the quantity of the mixture.

Choose appropriate nozzle type and size according to the crop and required water consumption. Use the nozzle tables.

Fill the reservoir with one half of the fresh water you will need.

Adjust the working pressure on the regulator and check the liquid flow rate through the nozzles.

Calculate the required water consumption per hectare according to the measured liquid flow rate through the nozzles and the working speed.

Fill the reservoir with the mixture and add the rest of the required water quantity.

While working, pay attention to a constant working speed, the height of the spraying boom, the working pressure and nozzle operation.

Clean the sprayer after you have finished working.
14 TYPES OF NOZZLES IN AGRICULTURE

14.1 NOZZLES WITH FLAT JET

This kind of nozzles is principally used for spraying with herbicides, insecticides and fungicides. The insecticide is precisely distributed along the whole working range of the nozzle. At lower pressure, the drops are bigger and less sensitive to wind and vice-versa. The recommended working height is 0.5 meter above the crop.

For reasons of correct overlapping of the jets, the nozzle adjustment is very important. The nozzles must be rapt for 5°-10° according to the boom.

Recommended working pressure:
- Herbicides: 1.5-3 bar
- Fungicides: 3-5 bar
- Insecticides: 3-5 bar

14.2 WHIRL NOZZLES

The jet of such nozzles in formed like a rotating cone. They consist of a whirling and a spraying part. Spraying parameter settings should be such that the overlap of jets between two nozzles is minimal. The main characteristic of these nozzles are smaller drops, the insecticide distribution is worse. They are suitable when spraying with fungicides and insecticides.

- Recommended working pressure: 2 - 10 bar
- Recommended working height: 0.5 meter.

A – Distance between nozzles

H – Height of nozzles above the crops
Δ – Spraying angle
14.3 WIND INFLUENCE

If possible, avoid spraying in windy conditions. If this is not possible, remember the following:
- use special nozzles ("Anti drift", injection nozzles, etc.)
- use nozzles with larger flow rate
- lower the pressure during spraying
- use nozzles which spray bigger drops (400 μm)
- reduce the working speed
- spray in wind direction.

14.4 WATER CONSUMPTION DURING SPRAYING

Adjust the water consumption to the way of working of the protection agent which will be used and the growth of the crop. Normally, the water consumption per hectare ranges from 100 to 600 litres. When using herbicides, which are commonly sprayed on weedy crops bare of plants, use smaller water quantities (from 100 to 300 litres). Too much water can lower the spraying efficiency, especially when using herbicides which are absorbed through the leaves of the weed. When spraying plants with fungicides and insecticides, a higher amount of water is normally used. Too much water, however, can cause insecticide to drip of the leaves and therefore loss of insecticide.
## TABLE 1: Flow rate of spraying nozzles type LECHLER (v l/min):

**REMARK:** THE NOZZLE FLOW RATES ARE ALWAYS THE SAME FOR THE SAME COLOUR MARKINGS OF DIFFERENT TYPES (ST, LU, AD, ID, TR, ETC.) AND NOZZLE MATERIALS.

</table>
Remark: check the actual flow rate of the nozzles by measuring it. If the flow rate of a nozzle at a specific pressure exceeds the table values for more than 10% than the nozzle insert is worn and needs to be replaced.

15.1 HOW TO USE THE TABLES

15.1.1 NOZZLE SELECTION

**Example:**

You have the following data:
- desired consumption per hectare of 400 l
- working speed: 6 km/h

1. In the speed column for 6 km/h in table 2 find the desired consumption per hectare of 400 l/ha.
2. See the flow rate of the nozzle on the left side of the table; in our case, this is 2.00 l/min;
3. Select the appropriate nozzle at specific pressure from table 1: e.g. TABLE 1, NOZZLE LECHLER, brown colour at a pressure of 3.2 bar.

15.1.2 SELECTING THE APPROPRIATE SPEED AND WORKING PRESSURE

**Primer:**
- desired consumption per hectare of 400 l/ha
- built in red LECHLER nozzles
- desired pressure between 2 and 4 bars
- desired speed between 4 and 6 km/h

1. Find your built in nozzles in table 1; the RED LECHLER nozzle has a flow rate of 1.26 l/min at a pressure of 2 bar; at a pressure of 4 bars the flow rate is 1.8 l/min.
2. Find the consumption value of 400 l/ha at a nozzle flow rate between 1.2 and 1.8 l/min in table 3; find the speeds 4-6 km/h in the vertical column. The results are:
   - 4.5 km/h at a pressure of 2.8 bar
   - 4.8 km/h at a pressure of 3.2 bar...

15.2 DIFFERENT CALCULATIONS

The water consumption values can be taken from the tables or calculated in accordance with the following equation:

\[
\text{WATER CONSUMPTION PER HECTARE (l/ha)} = \frac{1200 \times \text{FLOW RATE OF THE NOZZLE (l/min.)}}{\text{WORKING SPEED (km/h)}}
\]

The required flow rate of a nozzle per hectare and the working speed can be calculated with the help of the following equation:

\[
\text{FLOW RATE OF THE NOZZLE (l/min.)} = \frac{\text{CONSUMPTION (l/ha)} \times \text{WORKING SPEED (km/h)}}{1200}
\]

The simplest way to determine the tractor’s speed is to measure a certain distance and the required time to pass this distance:

\[
\text{SPEED (km/h)} = \frac{\text{PASSED DISTANCE (m)} \times 3.6}{\text{DRIVING TIME (s)}}
\]
